1 Abstract

Reference Manual for C/65 a small C Language compiler for use with Atari 400, Atari 800, and Apple II Computers

The programs, disks, and manuals comprising C/65 are Copyright (c) 1982 by Optimized Systems Software, Inc and LightSpeed Software

2 PREFACE

We realise that C/65 is not the most sophisticated, most complete, language on the market today, but we believe that the inherent power and flexibility that it exhibits within its compact size are a good match for the size and features of the machines it is intended for.

C/65 was authored by Sam Dillon and John Lowry, under the company name of LightSpeed Software, based on the Small C Compiler published in Dr. Dobb's Journal. C/65 is a hand-coded translation from C code to 6502 assembly language and is, as result, a fast and easy to use compiler.

3 TRADEMARKS

The following trademarked names are used in various places within this manual, and credit is hereby given

OS/A+, BASIC A+, MAC/65, and C/65 are trademarks of Optimized Systems Software, Inc.

4 Introduction

C/65 is a subset of the C programming language as defined by Kernighan and Richie in the book, "The C Programming Language", published by Prentice-Hall.

With a few clearly noted exceptions, programs written in C/65 are compatible without modification under Standard C.

The C/65 package comes with a runtime library, which includes standard-looking character input and output functions, all of which are described later in this document. The output of the C/65 compiler is MAC/65 assembly language, which must be run through the MC/65 assembler to produce a runnable object module. It is possible for this to be done automatically. Since the output is assembly language, it is easy to write your own assembly language routines that are compatible with the code generated by this compiler.

4.1 What's in it

Very briefly, C/65 supports

- the basic data types CHAR and INT
- pointers to the basic types (*)
- one dimensional arrays of the basic types (|)
- the basic arithmetic, logical, and bit operations familiar to C programmer
- simple source level character substitution (\$DEFINE)
- file inclusion of C source code
- file inclusion of assembly language sourcecode (not compatible with standard C)
- functions with parameters and Local variables
- an if statement, with an optional else clause
- a while statement
- break and continue statements
- a return statement, with an optional return value
- compound statements grouped by braces (although '(and)' must be used instead of '(' and ')')
- separate compilation
- linked external declarations

4.2 What's not in it

for experienced C programmers, use of the following standard C will get you in trouble:

- long ints
- unsigned ints (but note that pointers to char will do most of what you want here)

- floats and doubles
- structures, unions and bit fields
- multi-dimensional arrays
- parameters to `$DEFINE` macros
- `+=` and his brothers `--`, `*=`. etc
- `for` statement
- `do-while` statement
- `switch` statement
- `&&`, `!!`, unary `!`

There are other restrictions not Listed here, but these seem to be the major ones. Despite this, C/65 is complete enough that one could write C/65 in itself, space considerations aside. For various reasons, C/65 is written in assembly language, which makes it extraemly fast and quite small.

5 Using C/65

Are you a C hacker already? Did the introduction (Sections 1.1 and 1.2) tell enough? Anquious to get started? Here you go!

After using your favorite text editor to create a C source file, enter the command to OS/A+:

```
C65 filename1 filename2 [-T
```

where

- `filename1` is the name of the source file
- `filename2` is the name of the output file
- `-T` is an optional flag which tells C/65 to include the C source text as comments in the assembler output file.

5.1 Special Notes

E: is a valid filename for either source or output files (or both). I.e., compiler output can go directly to the screen, or you can even type in your C program on the fly.

Assemble the output file using MAC/65. Consult your MAC/65 reference manual for details of this operation. A complete, start to finish, compilation and assembly is shown in the next section.

Note: MAC/65 may be used to edit C source files if TEXTMODE is selected (via the TEXT command).
